

Construction

Represent process states
and physical relations

Enforce encoded relations
within the
output mapping

Guarantee depends on
the stated representation

Training

Fit observations with
physical residual penalties

Penalties guide the fit
alongside the
data objective

Small residuals do not
certify every new output

Returned state

Apply a defined
projection to a
completed prediction

Impose declared relations
on each returned state

Feasibility alone leaves
process accuracy
unresolved

Compare mass conservation and non-negativity on the same returned state
