

Construction

Training

Returned state

Model process states
and physical relations

Fit observations with
physical residual penalties

Apply a defined
projection to a
completed prediction

Enforce encoded relations
within the
output mapping

Penalties guide the fit
alongside the
data objective

Impose declared relations
on each returned state

Guarantee depends on
the stated model

Small residuals do not
certify every new output

Feasibility alone leaves
process accuracy
unresolved

Compare mass conservation and non-negativity on the same returned state
